From: Alan Danskin, Chair, JSC
Subject: Statement of objectives and principles for RDA

RDA — Resource Description and Access

Objectives and Principles

The statement of objectives and principles for RDA that follows has been used to guide the development of content for the first release of RDA.

It should be noted that while the statement of objectives and principles serves to provide overall guidance for the development of RDA, trade-offs sometimes have to be made between one principle and another. For example, the principle of uniformity needs to be balanced with the principle of common usage, the principle of accuracy needs to be balanced with the principle of representation, etc.

1. Objectives and Principles for the Design of RDA

The objectives and principles set out in this section are those that govern the overall design of RDA as a standard for resource description and access. They address matters of scope, formulation, currency, etc.

Objectives

Comprehensiveness
The guidelines and instructions should cover all types of resources and all types of content represented in catalogues or similar tools.

Consistency
The guidelines and instructions should be consistent in their formulation.

Clarity
The guidelines and instructions should be clear and written in plain English. They should be unambiguous with respect to underlying concepts, terminology, and scope of application.

Rationality
The guidelines and instructions should reflect rational, non-arbitrary decisions.
Currency
The guidelines and instructions should be responsive to new developments affecting the range, nature, and characteristics of the resources and types of content covered, and to the emergence of new types of resources and content.

Compatibility
The guidelines and instructions should be compatible with internationally established principles, models, and standards.

Adaptability
The guidelines and instructions should be amenable to adaptation by various communities to meet their specific needs.

Ease and efficiency of use
The guidelines and instructions should be easy and efficient to use.

Format
The guidelines and instructions should be amenable to presentation in either a conventional print format or in a digital format embodying features such as hypertext links, selective display, etc.

Principles

Generalization
For each element of the description the guidelines and instructions should provide substantive basic instructions that are applicable to all types of resources.

The guidelines and instructions on relationships should provide substantive basic instructions that are applicable to all types of content.

The guidelines and instructions on access point control should provide substantive basic instructions that are applicable to all types of name and title access points.

Specificity
Where required, the guidelines and instructions should provide supplementary instructions applicable to a specific type of content, medium, mode of issuance, relationship, name, title, etc.

Non-redundancy
The guidelines and instructions should avoid unnecessary repetition.

Terminology
The terminology used in the guidelines and instructions should be consistent with the concepts and terms defined in Functional Requirement for Bibliographic Records and Functional Requirements for Authority Data.
Reference structure

The reference structure embodied in the guidelines and instructions should be consistent in its overall design and serve as an efficient means of indicating the location of additional guidelines and instructions that may be relevant to the application of the guideline or instruction from which the reference is made.

2. Functionality of Records Produced Using RDA

The objectives and principles set out in this section are those that relate to the functionality of the descriptive data and access point control data produced through the application of RDA guidelines and instructions. They address matters of responsiveness to user needs, cost efficiency, etc.

The IFLA Statement of International Cataloguing Principles\(^1\) informs the cataloguing principles used throughout RDA.

Objectives

Responsiveness to user needs

The data should enable the user to:

- *find* resources that correspond to the user’s stated search criteria;
- *find* all resources that embody a particular work or a particular expression of that work;
- *find* all resources associated with a particular person, family, or corporate body;
- *find* all resources on a given subject;
- *find* works, expressions, manifestations, and items that are related to those retrieved in response to the user’s search;
- *find* persons, families, and corporate bodies that correspond to the user’s stated search criteria;
- *find* persons, families, or corporate bodies that are related to the person, family, or corporate body represented by the data retrieved in response to the user’s search
- *identify* the resource described (i.e., confirm that the resource described corresponds to the resource sought, or distinguish between two or more resources with the same or similar characteristics);
- *identify* the person, family, or corporate body represented by the data (i.e., confirm that the entity described corresponds to the entity sought, or distinguish between two or more entities with the same or similar names, etc.);
- *select* a resource that is appropriate to the user’s requirements with respect to the physical characteristics of the carrier and the formatting and encoding of information stored on the carrier;
- *select* a resource that is appropriate to the user’s requirements with respect to form, intended audience, language, etc.;

• *obtain* a resource (i.e., acquire a resource through purchase, loan, etc., or access a resource electronically through an online connection to a remote computer);

• *understand* the relationship between two or more entities;

• *understand* the relationship between the entity described and a name by which that entity is known (e.g., a different language form of the name);

• *understand* why a particular name or title has been chosen as the preferred name or title for the entity.

**Cost efficiency**

The data should meet functional requirements for the support of user tasks in a cost-efficient manner.

**Flexibility**

The data should function independently of the format, medium, or system used to store or communicate the data. They should be amenable to use in a variety of environments.

**Continuity**

The data should be amenable to integration into existing databases (particularly those developed using *AACR* and related standards).

**Principles**

**Differentiation**

The data describing a resource should differentiate that resource from other resources.

The data describing an entity associated with a resource should differentiate that entity from other entities, and from other identities used by the same entity.

**Sufficiency**

The data describing a resource should be sufficient to meet the needs of the user with respect to selection of an appropriate resource.

**Relationships**

The data describing a resource should indicate significant relationships between the resource described and other resources.

The data describing an entity associated with a resource should reflect all significant bibliographic relationships between that entity and other such entities.

**Representation**

The data describing a resource should reflect the resource’s representation of itself.
The name or form of name designated as the preferred name for a person, family, or corporate body should be the name or form of name most commonly found in resources associated with that person, family, or corporate body, or a well-accepted name or form of name in the language and script preferred by the agency creating the data. Other names and other forms of the name that are found in resources associated with the person, family, or corporate body or in reference sources, or that the user might be expected to use when conducting a search, should be recorded as variant names.

The title designated as the preferred title for a work should be the title most frequently found in resources embodying the work in its original language, the title as found in reference sources, or the title most frequently found in resources embodying the work. Other titles found in resources embodying the work or in reference sources, or that the user might be expected to use when conducting a search, should be recorded as variant titles.

**Accuracy**

The data describing a resource should provide supplementary information to correct or clarify ambiguous, unintelligible, or misleading representations made on sources of information forming part of the resource itself.

**Attribution**

The data recording relationships between a resource and a person, family, or corporate body associated with that resource should reflect attributions of responsibility made either in the resource itself or in reference sources, irrespective of whether the attribution of responsibility is accurate.

**Common usage or practice**

Data that is not transcribed from the resource itself should reflect common usage in the language and script preferred by the agency creating the data.

The part of the name of a person or family used as the first element in recording the preferred name for that person or family should reflect conventions used in the country and language most closely associated with that person or family.

**Uniformity**

The appendices on capitalization, abbreviations, order of elements, punctuation, etc., should serve to promote uniformity in the presentation of data describing a resource or an entity associated with a resource.
